## Abstract

Your abstract should contain a brief summary of your results. Aim for around 250 words. This is probably the last thing you write.

## 1 Introduction

The introduction introduces your reader to your project. Technical language and notation are generally not appropriate in this section.

## 2 Definitions and Development

Here is where you get technical. Derive your equations, develop your model, state basic definitions formally, etc. You will almost certainly need some definitions similar to Definition 1, so use this format.

**Definition 1.** A **new term** is an expression that you have not used before and that your reader needs to know about.

Of course, once you have a new definition, you will probably have a theorem or two telling us about what you discovered about your new term.

**Lemma 2 (Little Theorem).** *If  $x$  is a new term, then  $x$  is important to your readers. Most of your theorems will go in the Results Section, but little lemmas could go here.*

*Proof.* If the term was not important, you would not need to define it. □

**Example 3.** Examples should be numbered too.

Of course, we can refer to a theorem as Theorem 4 or as Fake Theorem. If you need to refer to Example 3, do so by number.

### 3 Results

What have you learned from what you did in the previous section? This section could contain graphs, tables, computations, proofs, etc. When you include equations or functions, you can put them into a sentence  $f(x) = x^2 \sin x$ , or you can set them apart

$$f(x) = x^2 \sin x.$$

Notice that you do need to punctuate. If you refer back to the equation, label it,

$$x^2 \sin x = 0, \tag{1}$$

and avoid statements like “the equation below.” Instead, refer to Equation (1).

**Theorem 4 (Fake Theorem).** *If  $x$  is a new term, then  $x$  is important to your readers.*

*Proof.* If the term was not important, you would not need to define it.  $\square$

The same holds for tables and graphs. Label the graph, include a caption, and refer to it via the label. See Figure 1.

### 4 Conclusion and Directions for Further Research

Draw some broad conclusions, and tell us what comes next.
